Sequence 2835, Application US/09925065A
Publication No. US20040181048A1
GENERAL INFORMATION:
APPLICANT: Wang, David G.
TITLE OF INVENTION: Identification and Mapping of Single
TITLE OF INVENTION: Nucleotide Polymorphisms in the Human Genome
FILE REFERENCE: 108827.135
CURRENT APPLICATION NUMBER: US/09/925,065A
CURRENT PILNG DATE: 2001-08-08
PRIOR APPLICATION NUMBER: US 60/243,096
PRIOR FILING DATE: 2000-10-24

HRI human cDNA sequencing project; cDNA 5- & 3'-end one pass
sequencing, clone selection and full insert sequencing: Helix
Research Institute (supported by Japan Key Technology Center etc.);
CDNA library construction: Institute of Medical Science, University
of Tokyo, Laboratory of Genome Structure, Human Genome Center.

entire insert of this NOTICE: This sequence may not represent the entire insert of this colone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by

Louis

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org

The clone sequenced to the left is RP11-562N2, 2000 bp overlap; the clone sequenced to the right is RP11-9D8, 2000 bp overlap. Actual start of this clone is at base position 1 of RP11-36B15; actual end is at base position 161070 of RP11-36B15.

A transposon was identified in the vector portion of the clone. There is an unresolved tandem repeat from base 71075 to 71587.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                               The present invention relates to novel human tumour necrosis factor (TNF) receptors, TR21 and TR22 and polynucleotides encoding them. Sequences of the invention are useful in the diagnosis, treatment and prevention of cancers (e.g., cancers of the adrenal gland, bone, urogenital or bone marrow, in particular breast and ovarian cancer), immune disorders (e.g., autoimmune haemolytic anaemia, rheumatoid arthritis, allergies, Addison's disease, ulcerative colitis), cardiovascular disorders (e.g., myocardial ischaemias), wound healing, neurological diseases (e.g., crebral anoxia, epilepsy) and infections diseases such as viral, bacterial, fungal and parasitic infections. They are also useful in gene therapy. The present sequence is a cDNA encoding human TR21 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-SEP-1997
```

The invention relates to nucleic acid sequences (AAV84411 to AAV84633)

cucoding human secreted proteins (AAW88534 to AAW88756). The secreted

cucoding human secreted proteins (AAW88534 to AAW88756). The secreted

cucoding pens sequences are deposited with the ATCC under deposit numbers

ATCC 97979, 97974, 97975, 97977, 209007, 209008, 209009, 209010,

cucoding comprising recombinant vectors containing the nucleic acid

sequences are used for the recombinant production of the secreted

cucoding comprising treating or ameliorating medical conditions e.g.

by protein or gene therapy. Pethological conditions e.g.

by protein or gene therapy. Pethological conditions e.g.

cucoding the presence of mutations in the new polynucleotides.

cucoding the presence of mutations in the new polynucleotides.

cucoding the presence of mutations in the new polynucleotides.

cucoding the diagnosis or treatment of cancer, neurodegenerative specific uses are described for each of the polynucleotides, based on confiscionates developmental abnormalities and focal deficiencies, blood disorders, tumours, leukemias, diseases and focal deficiencies, blood disorders, tumours, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, restenosis, prostate diseases, benchitis or malignancies, diseases of testes, lung cuch as osteoporosis, arthritis or malignancies, diseases of testes, lung partners. The present sequence represente and coloning a human secreted protein (see present sequence represente and clone identifying their binding partners. The present sequence represente and coloning a human secreted protein (see present sequence represente and clone identifying their binding partners. The present sequence represented and clone identification) 180 183 240 243 300 9 64 Ferrie AM, Ruben SM, Rosen CA, Hu J;

ABA83239 standard; cDNA; 1603

ABB50301 to ABB51287 and ABA83194 to ABA83441 represent human secreted proteins (I) and polynucleotide (II) sequences. (I) and (II) have various activities based on the tissues and cells the genes are expressed in.

Example of these activities include: immunomodulatory; antisclerotic; dermatological; immunosuppressive; antiinflammatory; immunostimulant; anti-angiogenic; optibalmological; cardiant; anti-angiogenic; optibalmological; neuroprotective; nootropic; anticonvulsant; antialzheimers; vascular; antiparkinsonian; antimicrobial; and vulnerary. (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) can be used in the prevention, diagnosts and treatment of immune disorders (e.g. multiple calcrosis, systemic lupus erythematosus and human immunodeficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and canchers diseases), cardiovascular diseases (e.g. Schintar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), angiogenic disorders (e.g. corneal graft neovascularisation and disbetic calcorpathy), neurological disorders (e.g. Huntington's chorcea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promocting wound healing, regeneration and/or chemotaxis. ABA83185 to ABA83193 and ABB50300 represent sequences used in the exemplification of Nucleic acids encoding 207 human secreted polypeptides, useful for preventing, diagnosing and/or treating, e.g. cancers, Parkinson's disease and diabetic retinopathy. Human; secreted protein; immunomodulatory; antisclerotic; anti-HIV; dermatological; immunosuppressive; antinflammatory; immunostimulant; orycestatic; cardant; vascular; anti-anglogenic; ophthalmological; neuroprotective; nootropic; anti-onvulsant; antialzheimens; vulnerary; antiparkinsonian; antimicrobial; gene therapy; vaccine; immune disorder; multiple sclerosis; systemic lupus erythematosus; HIV infection; cancer; human immunodeficiency virus; hyperproliferative disorder; wound healing; Gaucher's disease; cardiovascular disease; Scimitar syndrome; chemotaxis; corneal graft neovascularisation; diabetic retinopathy; regeneration; neurological disorder; Huntington's chorea; Alzheimer's disease; parkinson's disease; infectious disease; 88. New isolated protein, useful for preparing a composition for diagnosing or treating cancer, inflammatory, immune or infectious diseases.

Example 1; SEQ ID NO 56; 172pp; English.

The invention relates to an isolated HEWAE80 protein. The protein is useful for preparing a composition for diagnosing or treating autoimmune disorders e.g. multiple sclerosis and systemic lupus extrhematosus, haematopoietic cell disorders e.g. agammaglobulinaemia and ataxia telangiectsais; blood coagulation disorders e.g. afibrinogenaemia and thrombocytopenia; allergy; graft-versus-host disease; inflammatory conditions e.g. ischaemia-reperfusion injury and arthritis; hyperproliferative disorders e.g. cancer and purpura; infectious disease e.g. viral infection and bacterial infection. The polymucleotide or protein can be used to regenerate damaged tissue e.g. ulcers and Alzheimer's disease. The present sequence represents a novel human form part of the printed specification but was obtained in electronic format directly from USPTO at

ABO26522. The protein is encoded by one of 238 disclosed cDNA sequences encoding 238 secreted proteins. ABO26252 is a precerbellin-like protein. Also included are a composition composition composition and a carrier and an isolated protein produced by expressing the protein cited above by a cell, and recovering the protein. The proteins are useful for diagnosing or treating neurodegenerative and behavioural disorders (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, schizophrenia, mania, dementia, paranoia, psychoses or autism), immune disorders (e.g. hapatoblastoma, infermmention, allergy), liver disorders (e.g. hapatoblastoma, infermantiol arthitis, sepais, and psorders (e.g. Alzheimer's rheumatoid arthitis, sepais, and, psorders (e.g. Alzkeimia, rheumatoid arthitis, sepais, and, psorders (e.g. Alzkeimia, sequence is one of the 238 disclosed cDNAs encoding a novel secreted sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at:- seqdata.uspto.gov/sequence.html?DocID=6525174B1

```
which encode human secretory or membrane proteins represented by AAB88317

AAR88419. Included in the invention are primers AAF93917 - AAF94295 and
AAF82232 - AAF87235 which are used to isolate the CDNA sequences of the
invention. The invention also includes methods for the production of
antibodies directed against the proteins, and cDNA sequences, which can
be used in vaccines. The polymucleotide sequences can be used in gene
therapy. The polymucleotide sequences and the proteins they encode may be
therapy. The polymucleotide sequences and the proteins they encode may be
therapy. The polymucleotide sequences may also be used as DNA probes
the and in appropriate secretory protein/membrane protein expression. The
nucleic acids and complementary sequences may also be used as DNA probes
in diagnostic assays (e.g. polymerses chain reactions (PCR)) to detect
and quantitate the presence of similar nucleic acid sequences in samples.
They may also be used as antigens in the production of antibodies
complementary becaused their role in metabolism. The
polypeptides may be used as antigens in the production of antibodies
companies of expression and activity. The antibodies and antagonists
companies them and in assays to identify modulators (agonists and
activity. The antibodies may also be used as therapeutic agents to down regulate expression and
activity. The antibodies may also be used as diagnostic agents for
detecting the presence of the polypeptides in amples (e.g. by enzyme
companies). The antibodies may also be used as diagnostic agents for
detecting the presence of the polypeptides in amples (e.g. by enzyme
companies include rheumatoid arthritis and diabetes
                                                                          - AAF93916

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel human secretory proteins or membrane proteins, and their coding sequences. The present sequence is one such coding sequences of the invention are useful for examination and diagnosis of abnormality of the human secretary proteins and in gene therapy methods. The coding sequences and proteins are useful as candidates for medicines or as target molecules for developing medicines. Antibodies against the proteins of the invention are useful for treating diseases that are associated with the proteins Note: The sequence data for this patent did not form part of the printed specification, but was obtained from sequence information supplied by the European Patent Office.

The invention relates to an isolated polynuclectide encoding a polypeptide with biological activity. The polynuclectides and polypeptides are useful in diagnostics, forenaics, gene mapping, identification of mutations responsible for genetic disorders and other traits, to assess biodiversity, as nutritional sources or supplements. The polynucleotides may also be used as molecular weight markers, chromosome markers or map related gene positions, or as an antigen to raise anti-DNA antibodies or elicit immune response. The polypeptides are useful for raising antibodies, as markers for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and/or nerve tissue growth or cregeneration, in wound healing, in tissue repair and replacement, in healing of burns, incisions and ulcers, and in treating cancer. The present sequence represents cDNA encoding a novel human protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotides and secreted proteins, useful for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and nerve tissue growth or regeneration, in wound healing, and in tissue repair and

The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fily, see urchin and tomato. These were derived from expressed sequence tags (ESTs from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDN of the invention
                                                                                                                                                                         Isolated polypeptide for treatment of diseases, diagnostics, raising antibodies and research use.

The polynucleotides may also be used as molecular weight markers, chromosome markers or map related gene positions, or as an antigen to raise anti-DNA antibodies or elicit immune response. The polypeptides useful for raising antibodies, as marker for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and/or nerve tissue growth or regeneration, in wound healing, in tissue repair and replacement, in healing of burns, incisions and ulcers, and in treating cancer. The present sequence represents a novel human expressed sequence tag, EST.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
```

other

The invention relates to an isolated polynucleotide encoding a polypeptide with biological activity. The polynucleotides and polypeptides are useful in diagnostics, forenaics, gene mapping, identification of mutations responsible for genetic disorders and othe traits, to assess biodiversity, as nutritional sources or supplements.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which encode human secretory or membrane proteins represented by AAB88317

AAB88419. Included in the invention are primers AAF93917 - AAF94295 and
AAF62235 - AAF62235 which are used to isolate the CDNA sequences of the
invention. The invention also includes methods for the production of
antibodies directed against the proteins, and CDNA sequences, which can
be used in vaccines. The polymucleotide sequences can be used in gene
therapy. The polymucleotide sequences and the proteins they encode may be
used in the prevention, treatment and diagnosis of diseases associated
with inappropriate secretory protein/membrane protein expression. The
nucleic acids and complementary sequences may also be used as DNA probes
in diagnostic assays (e.g. polymerses chain reactions (PCR)) to detect
and quantitate the presence of similar nucleic acid sequences in samples.
They may also be used to study the expression and function of secretory
proteins/membrane polypeptides and their role in metabolism. The
polypeptides may be used as antigens in the production of antibodies
contains and in assays to identify modulators (agonists and
antiagonists) of expression and activity. The antibodies and antagonists
may also be used as therapeutic agents to down regulate expression and
cativity. The antibodies may also be used as diagnostic agents for
detecting the presence of the polypeptides of diseases which may be
linked immunosorbant assay (ELISA). Examples of diseases which may be
treated include rheumatoid arthritis and diabetes
                                                                                                                                                                                                 Primer specific for DNA encoding secretory/membrane protein SEQ ID 466.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to nucleic acid sequences AAF93744 - AAF93916
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding secretory proteins/membrane proteins, useful gene therapy or as candidate target molecules in drug development.

                                                                            ઠ
                                                                                                                                                                                                                              The present invention relates to novel human secretory proteins or membrane proteins, and their coding sequences. The coding sequences of the invention are useful for examination and disponsis of abnormality of the human secretary proteins and in gene therapy methods. The coding sequences and proteins are useful as candidates for medicines or as target molecules for developing medicines. Antibodies against the proteins of the invention are useful for treating diseases that are associated with the proteins. The present sequence is a 5'-end sequence of one such coding sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was patent and acquence information supplied by the Buropean Patent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a new first nucleic acid molecule comprising a polynuclectide sequence given in the specification. Also described are: an animal injected with the nucleic acid molecule, a second nucleic acid molecule comprising a second polynuclectide sequence that is at least about 70, 80, 90 or 95* homologous to the first nucleic acid molecule or that hybridises to the first polynucleotide sequence under high stringency conditions; a vector comprising the nucleic acid molecule and a promoter that drives the expression of the nucleic acid molecule and host cell transformed, transfected, transduced or infected with the

WO200218632-A2 Homo sapiens.

methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonacieotides and/or peptide-nucleic acid (PNA) oligonace and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligonaces, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13110-1605. This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DAN. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of cligomers, the degree of methylation is calculated. The method is used:

(1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastroineestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. Abglistion attatus of many C residues to be determined simultaneously. Abglistion determining the degree of cytosine methylation described in the
                                                                                                                                                                                                                                                                                                                                                                                                                        Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 694 BP; 232 A; 302 C; 86 G; 74 T; 0 U; 0 Other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
